

RaktSanket – Example Sample Dataset

Illustrative data only: 20 example records for each of the three related tables. Values are synthetic and are intended to demonstrate the dataset structure, not represent real blood-bank or donor records.

RaktSanket – Donor and Notification Data

The donor table supports donor-response probability; the notification table records contact history used for fatigue-aware prioritization.

How the three tables connect: Donor ID links the Donor and Notification tables. Blood Group links donor eligibility with blood-stock requirements. The three model outputs can be combined into CBSRI: Shortage Forecast Score + Donor Response Probability + Fatigue-Adjusted Priority Score.

Important: This is a sample schema for demonstrating your project. For the actual RaktSanket dataset, replace synthetic values with verified historical blood-bank, donor-consent, and notification records where available.
